

No Fixed Shape

Puzzle Overview

Walls begin appearing around the player one at a time until they are completely enclosed. There are four wallpapered walls, no visible doors or windows, and a single lightbulb hanging from the ceiling.

The room is not real. It does not abide by any logical understanding of physics. It is almost as if it is trying to remember what a room is supposed to look like, but it cannot keep the details consistent.

The player examines the room, notices that it changes according to what they look at, tests its physics, and becomes lucid. A door eventually becomes stationary, but the door is not the real exit. Going through it only leads to another version of the same room.

Objective

The apparent objective is to find and open the missing door. The actual objective is to realize that the player is dreaming, become lucid, and wake up by closing their eyes.

The Room

The puzzle takes place inside one empty room with four walls, a floor, a ceiling, and one lightbulb. There are no objects to collect and no physical keys.

The walls are not real. The room can change its shape, size, or volume depending on what the player last examined. Looking closely at a wall can make it move farther away or become closer. Looking between different surfaces makes the corner seams fade until the walls melt into one big wall.

Both routes lead to the same realization: the room has no fixed shape and reacts to the player's attention.

The Wallpaper

The wallpaper looks alive, as if bacteria or fungus is growing underneath it and pulsing like a heartbeat. Every time the player checks it, the pattern changes. Shapes move, grow, split apart, or join together differently.

If the player keeps examining it, the wall changes distance and the volume of the room changes. If they keep looking between the walls, the seams fade and the separate walls melt into one continuous surface.

The Lightbulb

The lightbulb is the only stable thing. It never moves, disappears, or changes size. The room changes around it, but its light still reaches every wall even when that should be impossible. This gives the player something stable to compare against the changing room.

The First Door

After examining a second part of the room, the player accidentally steps backward and bumps into a stationary door. When they turn around to look at it, it disappears and leaves a blank wall. Before the player becomes lucid, the door cannot remain there while it is being observed.

Full Walkthrough

1. Walls appear around the player until they are enclosed in an empty room.
2. The player examines the wallpaper and notices that it looks alive and pulses like a heartbeat.
3. The player examines another surface. While focused on it, they step backward and bump into a door.
4. The player turns around. The door disappears and a blank wall is left behind.
5. The player examines the wallpaper again. Its pattern has changed, and the room becomes larger or smaller while the lightbulb stays in place.
6. The corner seams begin fading and the walls melt into one continuous surface. The player realizes the room cannot keep a fixed shape.
7. The player tests the room or their own body. Only one physical reality check is required.
8. The impossible result confirms that normal physics do not apply. The player realizes this is happening inside their mind and becomes lucid.
9. The door becomes stationary and can now be looked at directly. It has no lock, handle, or doorknob. The player simply decides that it opens or that they can pass through it.
10. The player enters another room that is almost the same. When they look back, the old door is gone without a seam or any sign that it was ever there.
11. The player realizes that going through doors only repeats the room. They are basically running in place inside their own mind.
12. The player closes their eyes while lucid. The room disappears and they wake up.

Physical Reality Checks

The player can try to cross the room, but the opposite wall moves away at the same speed. They can jump and have the floor drop away beneath them. They can climb a wall and have it rotate into the floor. They can intentionally fall and have the floor bend away before impact.

They can also count their fingers or pinch themselves. Their finger count changes, or the pain arrives late, as if the dream had to invent the feeling after it happened. Any one of these tests can provide full lucidity.

The Door and Repeating Room

Lucidity is the key that is not a key. The door was never locked, so once lucid, the player can make it open. However, it is not the real exit.

The next room is slightly different but still the same: four walls, changing wallpaper, one lightbulb, and no visible exit. The previous door disappears as soon as the player enters. Continuing through doors only creates more rooms.

Hint Progression

Early hint: "The wallpaper may not look the same the next time you examine it."

Room-change hint: "The lightbulb has not moved. Everything around it has."

Door hint: "You were certain something solid was behind you."

Physical-test hint: "If the room cannot keep its shape, what else might not behave normally?"

Lucid-door hint: "The door was never physically locked."

Repeating-room hint: "You passed through the door, but did you actually go anywhere?"

Final hint: "The room only exists while you continue observing it."

Keys That Are Not Keys

The changing wallpaper is a clue rather than an object. The stable lightbulb proves that the room itself is changing. The physical reality check creates lucidity. Lucidity opens the handleless door, and closing the player's eyes becomes the real exit.

Puzzle Design Breakdown

The objective begins clearly: find a way out. The investigation area is limited to one room, so the player is not searching a large space. The room is unstable, but its rules are stable: it changes when observed, while the lightbulb stays the same.

The clues become clearer in order. The wallpaper changes first, the room changes next, and physical tests finally prove that none of it is real. The puzzle encourages exploration because examining the same things again produces different results.

The three main steps are unique but thematically connected: notice the room changing, test its impossible physics, and use lucidity to control it. Opening the door appears to solve the puzzle, but the repeating room shows that a physical door cannot lead out of the player's own mind. The player must stop searching for a door, close their eyes, and wake up.
